

Audio Ancillaries

In order to accommodate the differing needs of platforms we support a large number of audio ancillaries for use with our equipment. These ancillaries have been interfaced and matched to our systems and also verified against EMI/EMC standards.

Headsets

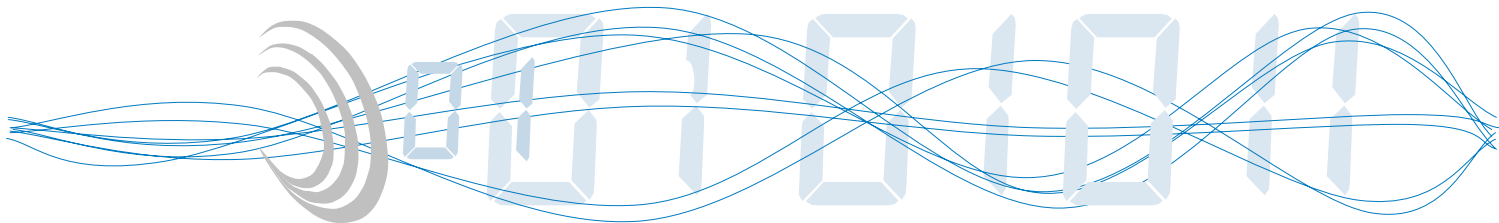

In order to achieve compliance with Health and Safety standards in country different headsets are required depending upon the noise profile of the platform. For extreme noise environments Active Noise Reduction (ANR) headsets are preferred but in platforms with lower ambient noise levels passive headsets are acceptable.

ANR Headsets

We offer three different types of ANR headsets for the different crew roles. Primarily the headsets can be used in tracked vehicles through to wheeled vehicles and each will provide different degrees of hearing protection based on

the ambient noise levels. For specific platforms please contact us for advice on this subject.

Passive Headsets

For dis-mounted or wheeled applications the use of passive headsets provide adequate protection for users in these

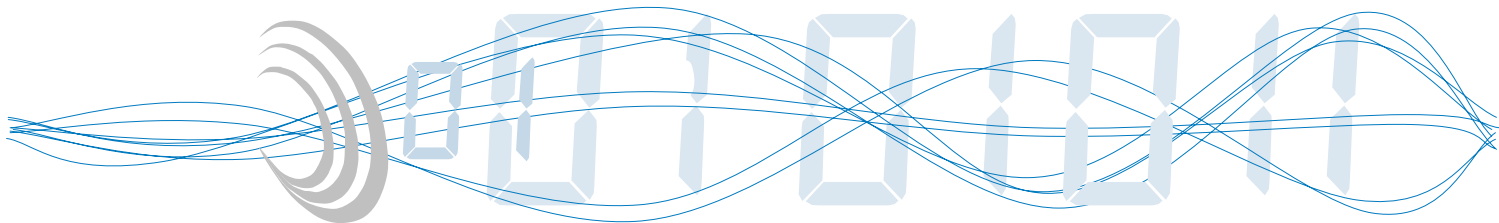

vehicles. The range is similar to the ANR variants, however, the following headsets are available purely as a passive solution.

Handsets

Various handsets are available for use with all of the products. Every product uses a handset compatible interface in conjunction with the standard headset interface.

PTT Units and Cables

In addition to the use of the passive and ANR headsets the headsets may require a "pressel" or PTT (Push To Talk) box to allow signals on the intercom to be keyed for the radio and intercom.
